

T-BAR ADJUSTER CORALLY SP12

This T-Bar adjuster makes it possible to change the handling of the Corally SP12, especially on high grip tracks. Sometimes the rear end of the SP12 has too much grip, resulting in flipping over of the car. With this T-Bar adjuster mounted, you can reduce the grip of the rear wheels, and improve the handling of the car. The T-Bar adjuster can be mounted in two ways, each resulting in a different handling. With the fixing screw in the most forward hole, the rear end of the car is at it's stiffest, (less grip at the rear) while with the screw mounted in the most rear-ward hole, the T-bar movement is a bit more flexible, with results in a bit more grip of the rear wheels.

As the T-Bar adjuster is positioned with two nylon screws, which rest at the chassis, it means that mounting of the T-Bar adjuster means also that the SP12 needs to be tweaked again before the start of a race.
